

[METHOD AND NETWORK SYSTEM FOR TRANSFERRING PROGRAMS]

Abstract of Disclosure

A network has a server and a plurality of terminals connected to the server. The terminals are capable of requesting the server to transfer a program. The server responds to the request of the terminals by broadcasting the program to the terminals. The method for transferring the program via the network uses a terminal to request the server to re-transfer the program when the terminal receives only a portion of the program requested by another terminal instead of receiving the complete program during a timeout period. The method and the network system for transferring programs are capable of substantially reducing the transferring time for an operating system and effectively improving the transferring efficiency to overcome the prior art shortcomings.
